Frost & Sullivan Award Analyst Quotes 2020 Global UPS New Product Innovation Award

The Frost & Sullivan analyst quotes can be leveraged in various ways. These can be posted on the Award recipient's website, included in press releases/blogs or posted on social media.

The concept of modularity is not new to the UPS industry, however, with its MODULYS XL, Socomec has taken modularity to the next level. Frost & Sullivan is impressed by this UPS system's uniquely ergonomic and flexible design that offers the best of both worlds: the highest degree of flexibility in a tailored custom solution that also delivers the advantages of standardized assets.

The level of focus and dedication the company has demonstrated to achieve the most optimum level of granularity in a modular UPS system is truly commendable. The MODULYS XL configuration perfectly balances mean time between failure and intrinsic redundancy. End users no longer have to worry about power module losses caused by missing modules or hiked-up service costs caused by adding more modules than necessary. Essentially, it offers the optimum module granularity for high-power UPS systems while maintaining the unique features and benefits of a true modular UPS system. Simply put, MODULYS XL brings a new level of sophistication to the modular UPS market.

Another intriguing design aspect that enhances the reliability and robustness of the entire UPS at a system level is its innovative and unique super-standardized inter-connection footprint, which does not stop at enhancing reliability, but simplifies and reduces installation time and cost to a high degree.

The MODULYS XL is extremely user friendly and designed with great attention to detail concerning safety and maintenance operation. Its concurrent serviceability allows for performing maintenance activities without any impact on the load protection level.
